This gene produces a truncated protein that has an estimated molecular weight of about 99 kDa and lacks the cytotoxic portion of the molecule. Thus this gene has a higher expression level than that of the full-length molecule. This can be used in the construction of a chimeric protein that comprises a leukotoxin polypeptide, several multimers, and a GnRH sequence. The chimeric protein can be used as a vaccine to help reduce the incidence of mammammary tumours in a mammalian individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         12;

The present sequence represents the LKT-GARH chimeric protein from pCB113. This plasmid contains the LKT 352 polypeptide (AAM79568) fused to four copies of the GARH peptide. This chimera lacks cytotoxic activity which enables there to be an increase in antigen presentation and thus an optimal immune response. The removal of this region also enables the truncated LKT to be expressed at much higher levels and allows the amount of antigen administered to be reduced. This chimeric protein comprises a leukotoxin polypeptide, several multimers, and a GARH

                                                                                                                                                                                                                                                      A chimeric protein (AAW03942) is composed of a fusion between a truncated leukotoxin (LKT-352) from Pasteurella haemolytica (see also AAW03945) and a 4-copy gonadoliberin-releasing hormone (GnRH) repeat sequence (see also AAW03944). It is the product of a chimeric gene (AAT37176) produced by ligating a synthetic sequence for the 4-copy GnRH into vector pAAJ52 (ATCC 68283), which carries the LKT-352 gene. Recombinant plasmid pCBL13 (LKT 352:4 copy GnRH, ATCC 69749) was obtd. Escherichia coli transformants produced the chimeric protein, which is useful as a vaccine for fertility control, esp. immunological sterilisation of

leukotoxin - used in vaccines and to raise monoclonal and polyclonal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a fusion between bovine gamma interferon (IFNgamma) and Pasteurella haemolytica leukotoxin (LTK). The leukotoxin gene, ltkA, was isolated from a gene library of P. haemolytica by chromosome walking. Immunogenic fusion proteins such as this can be used in vaccine compositions. It can also be used to raise mono- and polyclonal antibodies. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Length 1069;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    VSGITGVISTILQYSKOAMFEHVANKIHNKIVEWEKNNHGKNYFENGYDARYLANLODNM 422
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAW13866 and AAW13867 represent immunogenic chimeric proteins of the invention. This sequence represents a chimeric protein containing the bovine gamma interferon (gamma IFN) sequence and a leukotoxin sequence. The chimeric proteins of the invention comprise a cytokine, selected from interleukin-2 (IL-2) and gamma IFN, linked to at least one RTX toxin epitope (preferably the sequence shown in AAW13865). The RTX tox used to provide the epitope sequence is preferably a leukotoxin, especially the full-length Pasteurella haemolytica leukotoxin. Alternatively, the leukotoxin is a truncated leukotoxin lacking leukotoxic activity, especially LKT325. The chimeric proteins can be used for the production if vaccines against respiratory diseases such a pneumonia, particularly fibrinous pneumonia caused by P.haemolytica, including shipping fewer in cattle.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           99
                                                                                                                                                                  also
                                                                                fusion protein is immunogenic, and may be used in a natitier pasteurella vaccine composition. Pasteurella species, especially pasteurella haemolytica, are responsible for respiratory diseases in a range of agricultural animals, most particularly cattle, but also sheep, pigs, horses and fowl. Shipping fever is the most economically important respiratory disease associated with Pasteurella species, affecting 15-30% of exposed cattle and resulting in a 2-5% mortality are in the exposed population. The vaccine composition of the invention is is useful for preventing or ameliorating respiratory diseases such as pneumonia, particularly shipping fever pneumonia, in

                                                                                                                                                                                                                                                                                                                This protein is a 105 kD antigen which may be used in vaccines to protect cattle against shipping fever. The antigen is also useful for raising antisera which can be used for passive immunisation (for treatment or temporary prophylaxis) and also to raise antibodies which can be used in immunoassay methods for the detection of Pasteurella haemolytica antigens in biological fluids. (Updated on 25-WAR-2003 to correct PF field.)

removal of DNA sequence encoding the amino acids within the hydrophobic transmembrane domain of a full length leukotoxin protein. Modified leukotoxin sequences are used in vaccines to treat or prevent diseases associated with leukotoxin, e.g., respiratory disease, and Mannheimia infection (particularly M. haemolytica infection). In addition, the vaccine is used to prepare a medicament. Furthermore, the plant transformed with modified leukotoxin sequences is fed to an animal such as a ruminant, to prevent or treat respiratory diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8 KSNIQAGLNSTKSGLKNLYLAIPKD--YDPQKGGTLNDFIKAADELGIARLAEEPNHTET

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Oligonucleotides contg. sequences from bovine somatostatin (SRIF) gene were constructed on a Pharmacia Gene Assembler using standard phosporamidite chemistry. The oligonucleotides were annualed and ligated into vector pAA352 (contg. the Pateurella heamolytica leukotoxin gene) which had been digested with BamHI. The ligated DNA was used to transform E. coli strain JM105. Transformants contg. the oligonucleotide inserts were identified by restitction endonuclease mapping and the recombinant plasmid designated pAA495. The chimeric protein produced from the plasmid works to bring about a larger immune response than the antigen alone, i.e. the leukotoxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S0.0%; Score 2323.5; DB 14; Length 943; Similarity 50.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       oligonuclectides contg. sequences from bovine gonadotrophin releasing hormone (GRRH) gene were constructed on a Pharmacia Gene Assembler using standard phosporamidite chemistry. The oligonucleotides were annealed and ligated into vector paals2 (contg. the Pateurella heamolytica leuko-toxin gene) which had been digested with BamHI. The ligated DNA was used to transform E. coli strain MH3000. Transformats contg. the oligonucleotide inserts were identified by restiction endonuclease mapping and the recombinant plasmid designated pha8502. The chimeric protein produced from the plasmid works to bring about a larger immune response than the antigen alone, i.e. the leukotoxin works as a carrier protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          73 VNOFLSLTQTGIAISATKLEKFLQKHSTNKLAKGLDSVENIDRKLGKASNVLSTLSSFLG

                                                                                                                                                                                                                                  Plasmid pAA352 is derived from pAA114, a clone isolated from a genomic library of P. haemolytica. The protein, designated "new leukotoxin" or "LKT 352" is 984 homologous to authentic leukotoxin. LKT 352 and pref. antigenic fragments of it, can be used in vaccines to protect cattle from respiratory diseases. They can also be used to produce antibodies for immnosfifnity purificn. of further proteins. [Fig. contg. sequence v. poor]. see also AAR10890, AAR10909, AAR10910 and AAQ10783.
                                                                                    Pasteurella haemolytica proteins and genes - used for producing vaccines to protect animals esp. cattle from respiratory diseases e.g. pneumonia.

It is the product of plasmid pAA352 which carries a truncated lktA gene (AAT37179). A fusion protein (AAW03942) between LKT352 and a gonadotropin releasing hormone tetramer can be expressed in Escherichia coli. This is useful as a vaccine for fertility control, partic. immunological sterilisation of domestic or

The leukotoxin has cytotoxic activity specific against leukocytes. The protein is used to prepare vaccines or to raise antibodies against P. haemolytica to protect cattle from pneumonic pasteurellosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ANLQDNMKFLLNLNKELQAEAVIAITQQQWDNNIGDLAGISRLGEKVLSGKAYVHPFEEG

                                                                                                                                                                                                                                                                                                      99
                                                                                                                                                                                                                                                                                72
                         protein 4 (VP-4) gene were constructed on a Pharmacia Gene Assembler using standard phosporamidite chemistry. The oligonucleotides were annealed and ligated into vector pAA352 (contg. the Pateurella theamolytica leuko.coxin gene) which had been digested with BamHI. The ligated DNA was used to transform E. coli strain MH3000. Transformants contg. the oligonucleotide inserts were identified by restiction endonuclease mapping and the recombinant plasmid designated pAA501. The chimeric protein produced from the plasmid works to bring about a larger immune response than the antigen alone, i.e. the leukotoxin works as a carrier protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       67 IQTAIGLTERGIVLSAPQIDKLLQK---TKAGQALGSAESIVQNANKAKTVLSGIQSILG

                                                                   The present sequence is protein prod. of the Pasteurella suis leukotoxin gene pslktA, which together with the pslktC, and pslktB prods. comprises a high mol. wt. calcium dependent cytocoxic protein of the repeat of toxin family (RTX), capable of killing both BL-3 cells and pig lymphocytes. The leukotoxin proteins, and the pslktC, A and B genes, or fragments, can be used as immunogens in vaccines for the immunisation of pigs against diarrhoea, or as reagents in diagnostic assays. The leukotoxin genes were isolated by screening a P. suis genomic library, in the phage vector lambda-dash, with a DNA probe derived from pYFC19, a plasmid carrying the IKKCA locus (Chang et al., Infect. Immun., vol. 55, pp2348-2354, 1987).

It forms the appCA natigen with the appC arctein encoded on the same section of DNA. The appA antigen is not in itself haemolytic but does elicit an immune response and can be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

AAW22151-W22161 represent A. pleuropneumoniae RTX (repeat in toxins)

toxins. These sequence are encoded by the apxICA, apxIBD, apxIIABC, and

apxIIIABCD genes (see AAT73217-T73220), and can be expressed by

microorganisms used in the preparations of the invention. The

microorganisms used in the preparations of the invention. The

preparations are bacterial preparations comprising one or more RTX

con instance the strains have at least one cell-associated RTX toxin.

The preparations are used for production of vaccines for the prophylaxis

and treatment of infectious diseases caused by microorganisms that

produce RTX toxins, where the strains have been attenuated or

inactivated. The vaccines are preferably against Actinobacillus

pleuropneumoniae infection (swine pleuropneumonia). It has been found

that A. pleuropneumonia produces significant quantities of

cell-associated RTX toxins when cultured under certain conditions, and

that the whole-cell protein profiles obtained from cells recovered at

necropsy from the pleural fluid of infected swine. Vaccination with a

necropsy from the pleural fluid of infected swine. Vaccination with a

certain prepared from heat-inactivated cultures having significant

quantities of cell-associated RTX toxins give significant protection of

swine against challenge with homologous strains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 156

comparises one or more isolated and purified strain(s) of a microorganism, cultured in tryptone yeast extract (TYE) broth, which produces one or more RTX toxins, where the strain(s) broth, which produces one or more RTX toxins, where the strain(s) broth, which is call-associated. The products of the invention have immunostimulatory, antimicrobial, antimiflammatory, antiarthritic and antiabortive activity. The bacterial preparation may be used as vaccines for the prophylaxis and treatment of infectious diseases caused by strains of microorganisms which produce one or more RTX toxins. The infectious diseases are swine pleuropneumonia, pneumonia, septicemia, nephritis and arthritis in swine; septicemia, nephritis, endocarditis and arthritis in piglets; shipping cerver and abortion in cattle; whooping cough, sleepy foal disease or joint ill (purulent nephritis, arthritis) in foals; septicemia, polyarthritis and abortion in horses; and urinary infections, peritonitis, meningitis, and gastroenteritis. The bacterial preparations may also be used to prepare antibodies which may be used as a means of passive immunization. This sequence represents the Actinobacillus pleuropneumoniae clyIIA protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               238

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAW22151-W22161 represent A. pleuropneumoniae RTX (repeat in toxins) toxins. These sequence are encoded by the apxICA, apxIBD, apxIIABC, and apxIIIABCD genes (see AAT73217-T73220), and can be expressed by microorganisms used in the preparations of the invention. The preparations are bacterial preparations comprising one or more isolated and purified strains of a microorganism that produces one or more RTX
                                                                                                                                                                                                                                                                                                                                                   RTX toxin; apxICA gene; apxIBD gene; apxIIAB'C gene; apxIIIABCD gene; repeat in toxins toxin; cell-associated RTX toxin; vaccine production; therapy; A. pleuropneumoniae infection; swine pleuropneumonia.

toxins, where the strains have at least one cell-associated RTX toxin.

The preparations are used for production of vaccines for the prophylaxis
and treatment of infectious diseases caused by microorganisms that
produce RTX toxins, where the strains have been attenuated or
inactivated. The vaccines are preferably against Actinobacillus
pleuropneumonia e infection (swine pleuropneumonia). It has been found
that A. pleuropneumonia produces significant quantities of
cell-associated RTX toxins when cultured under certain conditions, and
that the whole-cell protein composition of the cultures corresponds to
the whole-cell protein profiles obtained from cells recovered at
necropsy from the pleural fluid of infected swine. Vaccination with a
bacterin prepared from heat-inactivated cultures having significant
quantities of cell-associated RTX toxins give significant protection of
swine against challenge with homologous strains.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel bacterial preparation (I) which comprises one or more isolated and purified strain(s) of a microorganism, cultured in tryptone yeast extract (TYE) broth, which produces one or more RTX toxins (belonging to the family of toxins referred to as Repeats in Toxins), where the strain(s) have at least one RTX toxin which is cell-associated. The products of the invention have immunostimulatory, antimicrobial, antimiclammatory, antiarthritic and antiabortive activity. The bacterial preparation may be used as vaccines for the prophylaxis and treatment of infectious diseases caused by strains of microorganisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        which produce one or more RTX toxins. The infectious diseases are swine pleuropneumonia, pneumonia, septicemia, nephritis and arthritis in piglets; shipping fever and abortion in cartle; whooping cough, sleepy foal disease or joint ill (purulent nephritis, arthritis) in foals; septicemia, polyarthritis and abortion in horses; and urinary infections,

                                                                                                                                                                                                                                                                                                                                                                                                                                             toxins. These sequence are encoded by the apxICA, apxIBD, apxIIABCC genes (see AAT71217-T71220), and can be expressed by microorganisms used in the preparations of the invention. The preparations of the invention. The preparations comprising one or more isolated and purified strains of a microorganism that produces one or more RTX toxins, where the strains have at least one cell-associated RTX toxin. The preparations are used for production of vaccines for the prophylaxis and treatment of infectious diseases caused by microorganisms that produce RTX toxins, where the strains have been attenuated or inactivated. The vaccines are preferably against Actinobacillus produce RTX toxins, where the strains have been attenuated or inactivated. The vaccines are preferably against Actinobacillus that A. pleuropneumoniae infection (swine pleuropneumoniae). It has been found that A. pleuropneumonia produces significant quantities of cell-associated RTX toxins when cultured under certain conditions, and the whole-cell protein profiles obtained from cells recovered at necropsy from the pleural fluid of infected swine. Vaccination with a chartities of cell-associated RTX toxins give significant protection of quantities of cell-associated RTX toxins give significant protection of swine against challenge with homologous strains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NHTETAKKSVDTVNQFLSLTQTGIAISATKLEKFLOKHSTNKLAKGL-DSVENIDRKLGK 119

                                                                                                                                                                                                                                                                             This invention describes a novel bacterial preparation (1) which comprises one or more isolated and purified strain(s) of a microorganism, cultured in tryptone yeast extract (TTE) broth, which produces one or more RTX toxins (belonging to the family of toxins referred to as Repeats in Toxins), where the strain(s) have at least one RTX toxin which is cell-associated. The products of the invention have immunostimulatory, antiarthritic and antiabortive activity.

CT he bacterial preparation may be used as vaccines for the prophylaxis and treatment of infectious diseases caused by strains of microorganisms which produce one or more RTX toxins. The infectious diseases are swine pleurophneumonia, pneumonia, septicimia, nephritis and arthritis in swine; septicemia, nephritis, endocarditis and arthritis in swine; septicemia, nephritis, and astruction in cattle; whooping cough, aleepy foal disease or joint ill (purulent nephritis, arthritis) in foals; septicemia, perparations cough, also preparations may also be used to prepare antibodies which may be used as a means of passive immunization. This sequence represents the Actinobacillus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         436

                                              AAR76991 represents the lhaA (low homology to appA) gene product. The lhaA protein (which is a toxin component and contains a repeat region) and fragments of this protein are useful as the active ingredient in vaccines for the prophylaxis of Actinobacillus (Haemophilus) pleuropneumoniae infectious (Apl) diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Modified leukotoxin polypeptide is useful in a vaccine to prevent or treat Mannheimia (Pasteurella) infection (particularly M. haemolytica infection), and disease associated with a leukotoxin, e.g., respiratory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is Pasteurella (Mannheimia) haemolytica modified leukotoxin-66 (lkt66) protein. The modification comprises the removal of amino acids within the hydrophobic transmembrane domain of a full length leukotoxin protein. Modified leukotoxin sequences are used in vaccines to treat or prevent diseases associated with leukotoxin, e.g., respiratory disease, and Mannheimia infection (particularly M. haemolytica infection). In addition, the vaccine is used to prepare a medicament. Furthermore, the plant transformed with modified leukotoxin sequences is fed to an animal such as a ruminant, to prevent or treat respiratory diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             LTTISTAL------GAVSAGVSAAAVGSAVGTPIALLVAGVTGLISGILBASKQAMF

colitis, haemolytic uremic syndrome and mesenteric adenitis have been found to carry a hlyk gene and a hyla gene, separated by an intergenic region. The hly genes and the intergenic region are absent from bacteria not associated with these diseases and so sprovide a useful target for detecting EHEC pathogens, esp. 0157:H7 serotype E.coli. The present sequence is that of the protein encoded by the EHEC hlyA gene.

Modified leukotoxin polypeptide is useful in a vaccine to prevent or treat Mannheimia (Pasteurella) infection (particularly M. haemolytica infection), and disease associated with a leukotoxin, e.g., respiratory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is Pasteurella (Mannheimia) haemolytica modified leukotoxin-50 (1kt50) protein. The modification comprises the removal of amino acids within the hydrophobic transmembrane domain of a full length leukotoxin protein. Modified leukotoxin sequences are used in vaccines to treat or prevent diseases associated with leukotoxin, e.g., respiratory disease, and Mannheimia infection (particularly M. haemolytica infection). In addition, the vaccine is used to prepare a medicament. Furthermore, the plant transformed with modified leukotoxin sequences is fed to an animal such as a ruminant, to prevent or treat respiratory diseases.

                                                                                    Novel Moraxella bovis antigen useful in compositions for raising immune response in an animal, has protease, lipase or hemolysin activity
                                                                                                                                                                          The invention relates to new Moraxella bovis antigens and nucleic acid sequences encoding these antigenic polypeptides. The antigenic polypeptides and polymucleotides are useful for raising an immune response in an animal directed against Moraxella, preferably against M. bovis or M. catarrhalis, and for treating Moraxella infections. The present sequence represents the amino acid sequence of the A subunit of the RTX toxin from M. bovis Dalton 2d.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SQLAKLGSTISQAKGFSNIGNKLQNINFSKTNLGLEIITGLLSGISAGFALADKNASTGK

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Enterohaemorrhagic E.coli (EHEC) associated with enterohaemorrhagic colitis, haemolytic uremic syndrome and mesenteric adentitis have been found to carry a hlyA gene and a hylB gene, separated by an intergenic region. The hly genes and the intergenic region are absent from bacteria not associated with these diseases and so provide a useful target for detecting EHEC pathogens, esp. 0157:H7 encoded by the EHEC hlyA gene.

contains. These sequence are encoded by the apxICA, apxIBA, apxIBA, apxIIABCC and apxIIABCD genes (see AAT73217-T73220), and can be expressed by microorganisms used in the preparations of the invention. The microorganisms used in the preparations of the invention. The preparations are bacterial preparations of the invention. The cand purified strains of a microorganism that produces one or more RTX toxins, where the strains have at least one cell-associated RTX toxin. The preparations are used for production of vaccines for the prophylaxis and treatment of infectious diseases caused by microorganisms that produce RTX toxins, where the strains have been attenuated or inactivated. The vaccines are preferably against Actinobacillus pleuropneumoniae infection (swine pleuropneumonia). It has been found that A. pleuropneumonia produces significant quantities of that A. pleuropneumoniae infection (swine pleuropneumonia). It has been found that the whole-cell protein composition of the cultures corresponds to the whole-cell protein composition of the cultures corresponds to the whole-cell protein composition of the cultures corresponds to the whole-cell protein fluid of infected swine. Vaccination with a necropsy from the pleural fluid of infected swine. Vaccination with a guantities of cell-associated RTX toxins give significant protection of swine against challenge with homologous strains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             comprises one or more isolated and purified strain(s) of a microorganism, comprises one or more isolated and purified strain(s) of a microorganism, cultured in tryptone yeast extract (TYE) broth, which produces one or more RTX toxins (belonging to the family of toxins referred to as Repeats in Toxins), where the strain(s) have at least one RTX toxin which is cell-associated. The products of the invention have immunostimulatory, antimurcobial, antihilammatory, antiarthritic and antiabortive activity. The bacterial preparation may be used as vaccines for the prophlaxis and transment of infectious diseases caused by strains of microorganisms transment of infectious diseases caused by strains of microorganisms of the prophlaxis and archritis and archritis in swine pleuropneumonia, pneumonia, septicemia, nephritis, endocarditis and arthritis in piglets; shipping septicemia, nephritis, endocarditis and arthritis in piglets; shipping fever and abortion in cattle; whooping cough, sleepy foal disease or joint ill (purulent nephritis, arthritis) in foals; septicemia, polyarthritis and abortion in horses; and urinary infections.

Compassive immunization. This sequence represents the Actinobacialus may also be used to prepare antibodies which may be used as a means of passive immunization. This sequence represents the Actinobacialus

RIX toxin, vaccine, Repeats in Toxins, immunostimulatory, antimicrobial, antiinflammatory; antiarthritic, antiabortive, treatment; pneumonia; pleuropneumonia; septicemia; nephritis; arthritis; endocarditis; shipping fever; abortion; whooping cough; sleepy foal disease; joint ill; urinary infection; peritonitis; meningitis; gastroenteritis;
                                                                                                 AAW22151-W22161 represent A. pleuropneumoniae RTX (repeat in toxins) toxins. These sequence are encoded by the apxICA, apxIBD, apxIIAB'C, and apxIIABD genes (see AAT72217-T73220), and can be expressed by microorganisms used in the preparations of the invention. The preparations are bacterial preparations comprising one or more isolated and purified strains of a microorganism that produces one or more RTX toxins, where the strains have at least one cell-associated RTX toxin. The preparations are used for production of vaccines for the prophylaxis and treatment of infectious diseases caused by microorganisms that
                                                                                                                                                                                                                                                                                      produce RTX toxins, where the strains have been attenuated or inactivated. The vaccines are preferably against Actinobacillus pleuropneumoniae infection (swine pleuropneumonia). It has been found that A. pleuropneumonia produces significant quantities of cell-associated RTX toxins when cultured under certain conditions, and that the whole-cell protein composition of the cultures corresponds to necropsy from the pleural fluid of infected swine. Vaccination with a bacterin propared from heat-inactivated cultures having significant quantities of cell-associated RTX toxins give significant protein profession with a partities of cell-associated RTX toxins give significant protection of swine against challenge with homologous strains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bacterial preparation comprising microorganisms which produce a member of the Repeats in Toxins (RTX) family, useful for treating swine
